

I would like to add the support of an active UK amateur to the proposal that the bottom segment of 160 metres (up to 1843 kHz) should be reserved for narrowband modes. I like to chase "DX" on 160, and it's sad when US amateurs choose to ragchew on SSB on top of the DX. They have all the rest of the band up to 2000kHz to ragchew in!

Can we "DX" stations and DX-chasers please have some support from the regulator in the most powerful and 160-metre active nation in the world?

Keith
